Contexte/Context

It is increasingly common to extract features from Music using machine learning models to solve tasks that were previously tackled using signal processing algorithm. Those new methods can be used to access to multiple pieces of information about the original content, such as the musical genre.

Therefore it is easier now to create automatic pipelines to solve fastidious tasks such as playlist curation.

Attendus du projet/Expectations

The work would consist in developing different genre classification methods [1,2,3], to benchmark them, and then using them to create an automatic playlist tool.

The tool could create automatic playlist that fits a defined mood by the user, or depending on the weather forecast, or from a given example track.
